Report about assignment1.

The assignment was about using sql language (DDL, DML, DCL) and using aggregation and grouping, joins and subqueries before we started learning about pl. But there's some things I gained and some challenges too, cause is about practical so sometimes it's hard to bug error so you have to keep trying it until u debug it that means it can take long time.

what I used for each question to be approached

- I used SELECT to retrieve data from tables.
- I used WHERE to filter records.
- I used GROUP BY and Aggregate functions such as Count, Sum, and Avg.
- I used Joins to combine related tables
- I used subqueries where one query depended on another
- I used Alter, Update, and Delete for the requires on another

What I revisited

- How to write and execute SQL queries.
- How to use aggregation and grouping.
- How to join tables.
- How to use subqueries.
- How to modify tables and data.
- How to use GitHub to store and submit my word

Challenges

- Understanding some SQL syntax.
- Identifying the correct column names.
- Solving the ORA-00904 invalid identifier error.
- Working with Oracle/SQL Developer.
- Understanding GitHub branches and pushing files.

What I could do better with enough time

- Practice more complex SQL queries.
- Test queries more carefully before submission.
- Organize my files and documentation earlier.
- Add more comments explaining my code.
